Otherwise, all the tests are performed according to the standard listed above. Different current is applied to the tests of different product models					

8. Characteristic Curves

Static dv/dt Test Circuit & Waveform

Measurement Method

The high voltage pulse is set to the required V_{PEAK} value and applied to the D.U.T. output side through the RC circuit above. LED current is not applied. The waveform V_T is monitored using a x100 scope probe. By varying R_{TEST} , the dv/dt (slope) is increased, until the D.U.T. is observed to trigger (waveform collapses). The dv/dt is then decreased until the D.U.T. stops triggering. At this point, τ_{RC} is recorded and the dv/dt calculated. $dv/dt = 0.632 \cdot V_{PEAK} / \tau_{RC}$

For example, $V_{PEAK} = 400V$ for KL302X series. The dv/dt value is calculated as follows: $dv/dt = 0.632 \cdot 400 / \tau_{RC}$
